Technical Specifications

SensolRIS MIO22M (and derived variants) is an addressable input-output module. The module monitors 2 analogue input signals and controls 2 relay outputs. The outputs can be set a monitored or non-monitored via jumpers on the module's PCB. The active state of the monitored outputs can be programmed for operation in Normal or Inverted Mode via the panel programming menus.

The module is powered on from the fire panel and can be controlled via the communication protocol. When an output is set as monitored, it must be powered on from an external power supply unit.

The module has a built-in isolator module which when used allows continuous operation of the loop in case of module's failure and without need of using additional isolator modules.
